```

For most projects, installing this default version of the NDK is sufficient. This can happen when you switch between different branches on the same project. When the installation is complete, click Finish. Clearing it uninstalls the NDK installed, freeing up disk space, and cause the checkbox to disappear from the list. If you've already read and agree to the license terms, then you can pre-accept the licenses in scripts with the following command: `yes | $(sdk/cmdline-tools/latest/bin/sdkmanager --licenses)` install the NDK and CMake When you install the NDK, Android Studio selects the latest available NDK. Android Studio installs all versions of the NDK in the `android-sdk/ndk/` directory. LLDB: the debugger Android Studio uses to debug native code. If Gradle is unable to find the version of CMake you specified in your `build.gradle` file, you get a build error. You do not need this component if you only plan to use `ndk-build`. Select the NDK (Side by side) checkbox and the checkboxes below it that correspond to the NDK versions you want to install. CMake: an external build tool that works alongside Gradle to build your native library. Make sure to also add the path to the Ninja installation to your `PATH` environment variable. This page describes how to install these components automatically, or by using Android Studio or the `sdkmanager` tool to download and install them manually. Install a specific version of the NDK To install a specific version of the NDK, do the following: With a project open, click Tools > SDK Manager. One command and new version is applied to all your projects. How to install Gradle On Mac: brew install gradle On Windows: download, unpack and install How to configure Android Studio Preferences in Android Studio Open Preferences -> Build, Execution, Deployment -> Gradle. Click the SDK Tools tab. With local distribution you can bump Gradle the same day stable version is released or even use release candidate version. If your project needs one or more specific versions of the NDK, though, you can download and configure specific versions. You signed out in another tab or window. Less daemons started in same time — less pressure on the system. Bump Gradle version independently from the project. It takes time until new version propagates everywhere. Either add the path to the CMake installation to your `PATH` environment variable or include it in your project's `local.properties` file, as shown. Linux package managers may distribute a modified version of Gradle that is incompatible or incomplete when compared to the official version (available from SDKMAN!) or below. All projects, all branches. You have multiple versions of the NDK installed and you want to use a specific one. `android { ndkVersion "major.minor.build" // e.g., ndkVersion "21.3.6528147" }` and `ndkVersion = "major.minor.build" // e.g., ndkVersion "21.3.6528147" }` Default NDK version per AGP version Before release, each AGP version is thoroughly tested with the latest stable NDK release at that time. For example: `gradle assembleDebug` How to see how many daemons are running Execute `gradle --status` SDKMAN! is a tool for managing parallel versions of multiple Software Development Kits on most Unix-like systems (macOS, Linux, Cygwin, Solaris and FreeBSD). Configure a specific version of CMake The SDK Manager includes the 3.6.0 forked version of CMake and version 3.10.2. Projects that don't set a specific CMake version are built with CMake 3.10.2. To set the CMake version, add the following to your module's `build.gradle` file: `android { ... externalNativeBuild { cmake { ... Doing so helps you ensure reproducible builds across projects that each depend on a specific version of the NDK. For more information, see Configure the NDK for the Android Gradle plugin, version = "cmake-version" } }` If you want to use a CMake version that is not included by the SDK Manager, follow these steps: Download and install CMake from the official CMake website. The default NDK version is documented inside the AGP release notes. For AGP version 3.6 and above, that NDK version will be used to build your projects if you do NOT specify an NDK version in the `build.gradle` file. You can't perform that action at this time. version "cmake-version" } } } and `{ ... Figure 2: The SDK Tools window showing the NDK (Side by side) options Note: If you have an NDK installed in the ndk-bundle folder, it appears in the list with the label NDK. Android Studio installs all versions of the NDK in the android-sdk/ndk/ directory. Clearing the checkbox uninstalls the NDK, freeing up disk space, and causes the checkbox to disappear from the list. Select Use local gradle distribution and specify Gradle home. On Mac: /usr/local/opt/gradle/libexec in case you installed it via brew. For Windows: specify the path where you installed Gradle. How to use from terminal Just use gradle instead of ./gradlew. In this case, specify the version using the android.ndkVersion property in the module's build.gradle file, as shown in the following code sample. A dialog box tells you how much space the NDK package(s) consumes. If you are using Gradle version 3.5 or later, you can select this checkbox or clear it. cmake.dir = "path-to-cmake" If you don't already have the Ninja build system installed on your workstation, go to the official Ninja website, and download and install the latest version of Ninja available for your OS. Figure 1: The SDK Tools window showing the NDK (Side by side) option Note: If you have an NDK installed in the ndk-bundle folder, it appears in the list with the label NDK. We deploy and maintain the versions available from SDKMAN!. To compile and debug native code for your app, you need the following components: The Android Native Development Kit (NDK): a set of tools that allows you to use C and C++ code with Android. Click OK. To install CMake and the default NDK in Android Studio, do the following: With a project open, click Tools > SDK Manager. A dialog box tells you how much space the NDK package consumes on disk. Resolve any errors that occur. Configure specific versions of the NDK in your project You may need to configure the version of the NDK in your project if one of the following is true: Your project is inherited and you need to use specific versions of the NDK and the Android Gradle plugin (AGP). You signed in with another tab or window. [{"type": "thumb-down", "id": "missingTheInformationINeed", "label": "Missing the information I need"}, {"type": "thumb-down", "id": "tooComplicatedTooManySteps", "label": "Too complicated / too many steps"}, {"type": "thumb-down", "id": "outOfDate", "label": "Out of date"}, {"type": "thumb-down", "id": "samplesCodeIssue", "label": "Samples / code issue"}, {"type": "thumb-down", "id": "otherDown", "label": "Other"}] [{"type": "thumb-up", "id": "easyToUnderstand", "label": "Easy to understand"}, {"type": "thumb-up", "id": "solvedMyProblem", "label": "Solved my problem"}, {"type": "thumb-up", "id": "otherUp", "label": "Other"}] Select the Show Package Details checkbox. The very first thing, that I'm doing after project import into Android Studio, is the switch from Gradle wrapper to local Gradle distribution. Your project automatically syncs the build file and performs a build. Configure each module with the version of the NDK you want it to use. Homebrew is "the missing package manager for macOS". If you uninstall the legacy NDK, remove the ndk.dir value, which is now deprecated, from your projects' local.properties files. If you uninstall the legacy NDK, remove the ndk.dir value, which is now deprecated, from your projects' local.properties files. When using Android Studio 3.6 or higher, if you do not specify the version, the Android Gradle plugin chooses a version that is known to be compatible with. By default, LLDB will be installed alongside Android Studio. Other package managers are available, but the version of Gradle distributed by them is not controlled by Gradle, Inc. You can install an Android Studio preview side-by-side with the stable version. Note: Preview releases (for example, canary and beta) of the NDK do not show up in this list unless you change the update channel for Android Studio. # If you set this property, Gradle no longer uses PATH to find CMake. That have two benefits: All projects can use same Gradle daemon. When you switch project A to project B and they have different gradle wrapper versions, Android Studio has to start different daemons. The current default NDK versions are listed in the following table: Android Studio/Gradle Plugin Version 7.0 4.2 4.1 4.0 3.6 3.5 3.4 Default NDK versions specified for the version of AGP 21.4.7075529 21.4.7075529 21.1.6352462 21.0.6113669 20.0.5594570 No default specified Content and code samples on this page are subject to the licenses described in the Content License. Select the NDK (Side by side) and CMake checkboxes. If you are using Android Gradle plugin 3.5.0 or later, you can select this checkbox or clear it. Java is a registered trademark of Oracle and/or its affiliates. Reload to refresh your session. Some teams are very fast in that, some are more conservative. Install NDK and CMake automatically Android Gradle Plugin 4.2.0+ can automatically install the required NDK and CMake the first time you build your project if their licenses have been accepted in advance. Specify the CMake version you want Gradle to use in your module's build.gradle file. Last updated 2022-01-27 UTC.`
